1 Testing Code Exports

Issues:

- Source blocks definitely need the right `:export` code setting
- Emacs themes are a bit tricky here. If possible export theme to `.tex`
- It seems there's an ox workflow for $\text{\LaTeX}$ where you export TeX then use `watchexec` to compile it (or emacs' compile-mode functionality)
 - you're going to want to read generated TeX source anyways.

Testing engraved-faces

proof-of-concept to see whether code exports work

```
(defun dc/ox-engraved-enable ()  
  (interactive)  
  ;; also customize `org-latex-engraved-preamble' and  
  ;; `org-latex-engraved-options'.  
  (setq org-latex-src-block-backend 'engraved  
        org-latex-engraved-theme 'doom-one-light))
```

They try to tell you...

They try to tell you...

One hell of a learning curve

It does seem to work, but you probably want a separate serverless emacs to use this. but loading `ef-themes` and then changing to a `doom-theme` created some invalid state.

They try to tell you...

One hell of a learning curve

It does seem to work, but you probably want a separate serverless emacs to use this. but loading ef-themes and then changing to a doom-theme created some invalid state.

But...

Emacs is much easier than you'd think. Mixing about 10 different languages and expecting org-export to generate five output formats... that's extremely difficult. Keep it simple.
